

Patient 3

Report A

649158310/05/2016 CT Acute Stroke

Clinical information:

Right arm and leg weakness.

Facet

? Stroke.

Findings: Note is made of an acute intraparenchymal haematoma centred onto the left paracentral lobule with the some surrounding oedema. There is some local mass effect with effacement of the adjacent cerebral sulci. A few foci of low density change are shown in the supratentorial white matter most likely representing a background of minimal small vessel disease.

No other significant finding.

Comment:

Acute haematoma centred onto the left paracentral lobule.

Report B

649 1904 11s05/2016 MR Head

6491904 11/05/2016 MR MRA

649 1904. 11105/2016 MR+C Head

Clinical Indications:

Admitted with haemorrhage with lesion within the bleed? SoL

Findings:

Comparison is made with the CT head dated 10/05/2016. The evolving haematoma centred on the left paracentral lobule is again shown. Within its centre, there is a conspicuous rounded focus of T1/FLAIR hyperintensity and more marked susceptibility effect, corresponding to the focal low density shown on the previous CT study, which is suspicious for an underlying lesion containing older blood products.

There is a moderate volume of oedema surrounding the haematoma with associated local mass effect. However, no midline shift is shown. Several patchy foci of T2-hyperintensity are noted within the cerebral white matter, in keeping with a background of modest small vessel disease. No additional neuroparenchymal lesion, foci of susceptibility or pathological enhancement is shown.

The TOF MRA demonstrates unremarkable appearances of the proximal intracranial arteries. It should be noted that the haematoma is not Covered on this sequence.

Impression:

The imaging features suggest the presence of an underlying lesion containing older blood products. Given the patient's age, a haemorrhagic metastasis should be considered, although intrinsic tumour and cavernoma remain within the differential. MDT discussion is Suggested to guide further investigation and management.
